TEVITA MATHIAS

Oak Harbor, WA | mathias.tevita@icloud.com | linkedin.com/in/tevita-mathias | github.com/aldohl95

EDUCATION

Skagit Valley College — Bachelor of Science in Computer Science 2024 – June 2027 (expected)

GPA: 3.5

Relevant Coursework: Data Structures & Algorithms, Operating Systems (in progress), Discrete Mathematics, Linear Algebra, Web Application Development, Software Development Tools, Cloud Fundamentals, UX/UI Design

PROJECTS

SaveMySeat — Event Ticketing Platform | Live demo | GitHub Java, Spring Boot

- Built and deployed a full-stack ticketing platform: a ~28-endpoint REST API (Java 25, Spring Boot 4) in a Docker container on Render with managed PostgreSQL, and a React + TypeScript front end on Netlify, shipped through a GitHub Actions CI pipeline.
- Eliminated overselling by enforcing a *reserved* + *sold* <= *capacity* invariant with PostgreSQL row-level pessimistic locking and a database CHECK constraint; a Testcontainers integration test fires 50 concurrent threads at a 10-ticket tier and verifies exactly 10 succeed.
- Documented the pessimistic-versus-optimistic trade-off in an Architecture Decision Record, then load-tested with k6: about 2,700 holds/sec on a single tier versus 4,350/sec across 21 tiers on a laptop, showing the row lock is the throughput ceiling.
- Modeled a time-boxed hold lifecycle (active, then converted, released, or expired) with a scheduled sweeper whose conditional UPDATE safely resolves races with concurrent checkout; unique order-per-hold constraint makes checkout idempotent.
- Secured the API with stateless JWT auth, refresh-token rotation with reuse detection, BCrypt, and ownership checks that return 404 to prevent ID enumeration; failures standardized as RFC 7807 Problem Details.
- Added structured JSON logging with per-user MDC correlation and Prometheus metrics; versioned the schema with 8 Flyway migrations and added partial indexes on active holds and pending/paid orders plus a composite index serving paginated order history.

InterviewPrep CLI — Interview Prep Tracker | PyPI: interviewprep-cli Python

- Shipped a pip-installable CLI to PyPI that schedules technical-interview review using spaced repetition weighted by self-rated difficulty and hint usage, with streak tracking and a progress dashboard.
- Implemented full CRUD attempt logging and JSON import/export with merge and replace modes; validated behavior with 42 pytest tests and published contributor documentation (SPEC, CONTRIBUTING, PR templates).

Task Mentor — Team Mentoring Platform | GitHub Spring Boot, React

- Led a 4-person team as project manager on a full-stack mentoring platform, authoring 61 of 92 commits and running branch strategy and pull-request review through production deploys on Render and Netlify via Docker.
- Owned authentication end to end — Spring Security JWT backend through React protected routes and auth context — and delivered the dashboard search feature.
- Unblocked teammates by diagnosing cross-cutting CORS, routing, and frontend–backend integration defects late in the release cycle.

EXPERIENCE

Store Manager — Gamers Only | Hinesville, GA May 2018 – December 2022

- Grew store revenue 32% by pitching ownership on expanding to the TCGplayer online marketplace, then leading the rollout, listing card inventory online and standing up order fulfillment.
- Hired, trained, and scheduled a 4-person team while owning daily operations, purchasing, and inventory control for a gaming and trading-card retail store.

SKILLS

Languages: Java, Python, TypeScript, JavaScript, SQL, HTML/CSS
Frameworks: Spring Boot, Spring Security, Spring Data JPA, Hibernate, React
Infrastructure & Data: PostgreSQL, Flyway, Docker, Docker Compose, GitHub Actions, Render, Netlify, Prometheus, k6, Linux, AWS (foundational)
Testing & Practices: JUnit 5, Testcontainers, pytest, integration and load testing, REST API design, JWT authentication, Git/GitHub, Maven
